Kenji and a group of his friends decide to go swimming in a retaining pond that is behind a strip mall in South Miami. There is a "NO TRESPASSING" sign due to nuisance alligators that have been removed from the pond in the past. However, this doesn't bother the group of teens and they enjoy their afternoon. By the next night, Kenji is suffering from a debilitating headache and a high fever. His family rushes him to the hospital, where he is admitted. Within hours, he suffers convulsions and falls into a coma. He dies the next afternoon.

1. Diagnosis –

2. Causative agent –

3. Describe how the causative agent 'invaded' his body.

4. What drug and therapy is showing some promise for treating these types of infections?
