Jenny started daycare this year. Her mother is hoping that Jenny will acquire most of the 'childhood' illnesses while attending. After about two months, her mom is told by another mother that something is 'going around' and several children have been absent. Jenny, too, starts coming down with what her mom assumes is a cold – low grade fever, headache, and upset stomach. However, several days later a red, lacy facial rash appears. Within a few days, a second rash appears on her trunk and extremities. Her mother treats her cold-like symptoms and in a couple of weeks the rash has subsided.

a. Diagnosis –

b. Causative agent –

c. What is the name for the distinctive facial rash seen in this infection?

d. From where did this infectious disease get its name?

e. What are several complications seen in adults and the immunocompromised that acquire this disease?
