Skin and Eye Infections
Case Study 2

Keshaun is an 8-year-old second grader. A couple of weeks ago, he was sent home because he was showing symptoms of a highly infectious skin condition. The school administration was trying to limit the spread of the infection. Keshaun had a mild presentation and the infection cleared up on its own. But, about a week later, Keshaun was admitted to the hospital in critical condition. He was put on dialysis and his parents were told to expect the worse. After about another week, Keshaun’s kidney function improved enough that he was removed from dialysis. He eventually recovered completely.

a. Diagnosis –

b. Causative agent –

c. What was the sequela that had Keshaun so gravely ill?
